

# X3Profiler General State Diagram

Explanation: When program is started, it will wait for input data. When data is opened, the data check will detect if it needs parsing, if it does, it will be sent to the parser, if not, it will await more data. At this point, the user can decide to switch to nodes view to change the options, or to graph view to view the graph. At any time now, the user is allowed to open more data files, switch between nodes and graph view, as well as quit the application.
